

Realistic and real world solving Project Ideas for your BTECH defence

Project Idea 1: Security Alert & Community Safety App

The Problem: The Anglophone crisis has created a volatile security situation in Bamenda. Civilians face risks from armed clashes, abductions, and extortion. Humanitarian workers and residents struggle to navigate safely, and incidents like the disappearance of vulnerable internally displaced persons go unreported or unresolved. The unpredictability of violence makes daily life dangerous.

The Software Solution: A mobile and web-based community safety platform that allows verified users to anonymously report security incidents in real-time, creating a crowd-sourced safety map for Bamenda and the Northwest Region.

Core Features:

- **Anonymous Incident Reporting:** Users can report checkpoints, clashes, abductions, or suspicious activity without revealing identity
- **Real-Time Safety Map:** Color-coded zones showing current risk levels based on recent reports
- **Safe Route Planning:** Navigation feature that recommends safer routes avoiding high-risk areas
- **Emergency Broadcast System:** Push notifications for imminent threats affecting specific neighborhoods
- **Verified Humanitarian Corridors:** Integration with organizations like Caritas Bamenda to mark safe passages for aid delivery

Impact: This tool would empower residents with situational awareness, aid humanitarian organizations like Caritas and CRS in safely reaching vulnerable populations, and provide aggregated data for conflict analysis organizations like Defyhatenow to better understand and address the crisis.

Local Collaboration: Partner with organizations such as Defyhatenow, Caritas Bamenda, or local community leaders who already work on conflict monitoring and humanitarian assistance.

Project Idea 2: Waste Management & Recycling E-Commerce Platform

The Problem: Bamenda generates 120-160 tonnes of municipal solid waste daily, but with the Anglophone crisis causing failure of public services, waste now accumulates uncontrollably. Residents resort to burning trash or dumping in rivers, creating serious environmental and health hazards. No structured waste collection infrastructure currently exists.

The Software Solution: An e-commerce style platform that connects city residents with a professional waste collection team, enabling doorstep pickup, promoting waste separation education, and facilitating the sale of recyclable materials.

Core Features:

- **On-Demand Collection Booking:** Schedule waste pickup at preferred times through mobile app
- **Subscription Plans:** Weekly or bi-weekly collection services with mobile money payment integration
- **Educational Content:** Tutorials on waste separation, composting, and creating home gardens
- **Recyclables Marketplace:** Platform for households to sell separated recyclable materials (plastics, glass, metals) to recycling businesses
- **Collection Tracking:** Real-time tracking of collection vehicles with estimated arrival times
- **Impact Dashboard:** Visualize community participation and waste diverted from landfills

Impact: This project directly addresses Bamenda's waste crisis by creating a sustainable, tech-enabled collection system that improves public health, creates green jobs for youth, and reduces environmental pollution. It aligns with existing local efforts like CAEPA's "Waste Collect Project" while adding commercial sustainability through recyclables trading.

Local Collaboration: Partner with CAEPA (Community Agriculture and Environmental Protection Association) which has already initiated waste management work in Bamenda and has existing community networks .

Project Idea 3: Crisis-Affected Youth Digital Skills & Job Matching Platform

The Problem: The Anglophone crisis has forced schools to close in many areas (up to 80% in some zones), leaving young people without education or vocational training . Vulnerable youth, particularly young women, face increased risks of early pregnancy, sexual violence, and exploitation . Organizations like CEMASUD are working to provide ICT training but lack resources to reach all who need help .

The Software Solution: A digital platform that connects vulnerable, crisis-affected youth with free ICT training programs, mentors, and remote work opportunities, creating a pathway from skills development to sustainable employment.

Core Features:

- **Training Program Directory:** Map of free ICT training centers in Bamenda (like CEMASUD, Kitadis Centre, BLIS Global Center) with course details and enrollment status
- **Skills Assessment & Pathways:** Self-assessment tools to recommend appropriate training tracks (web development, digital marketing, hardware repair, etc.)
- **E-Learning Modules:** Free, offline-accessible courses for areas with limited internet connectivity
- **Mentorship Matching:** Connect learners with local tech professionals for guidance
- **Freelance Job Board:** Entry-level remote work opportunities for graduates
- **Safe Space Features:** Private support groups and psychosocial resources, particularly for young women facing vulnerability
-

Impact: This platform would amplify the work of organizations like CEMASUD by making their training programs more accessible and creating clear pathways to employment for

vulnerable youth . It addresses the educational crisis directly while building long-term economic resilience in the community.

Local Collaboration: Partner with CEMASUD, Kitadis Centre, BLIS Global Center, and the organizers of the Bamenda Community Challenge who already support tech innovation and youth empowerment .

Project Idea 4: IDP Assistance Coordination Platform

The Problem: Over 1 million people have been displaced by the Anglophone crisis . Displaced persons, like the 58-year-old woman who fled Bafut to Bamenda, face immense challenges including loss of documentation, lack of support networks, health complications, and continued threats . Humanitarian organizations struggle to coordinate assistance effectively across the region.

The Software Solution: A coordination platform for humanitarian organizations, government agencies, and community groups to manage assistance to internally displaced persons (IDPs) in the Northwest Region, preventing duplication of efforts and ensuring vulnerable individuals are not left behind.

Core Features:

- **IDP Registration Database:** Secure, privacy-focused registration system for displaced persons to receive coordinated assistance
- **Service Provider Directory:** Map of available services (food distribution, medical care, psychosocial support, legal aid) with real-time capacity updates
- **Case Management System:** Track individual cases requiring follow-up, particularly vulnerable populations like unaccompanied elderly or separated families
- **Resource Coordination:** Tool for organizations to coordinate supply deliveries and avoid duplication in specific areas
- **Referral Network:** Digital referral system between organizations for specialized needs (healthcare, mental health support, family tracing)
- **Reporting Dashboard:** Aggregate data for donors and government on assistance coverage and gaps

Technical Stack:

- Django / Flask backend with robust security

- PostgreSQL with PostGIS for geographic data
- OpenSRP (Open Source Social Registry Platform) for case management
- SMS/USSD integration for areas with limited internet
- Role-based access control for different organizations

Impact: This platform addresses the coordination failures that leave displaced persons like Lem Shenah vulnerable after fleeing violence . By enabling organizations to work together effectively, it ensures that limited humanitarian resources reach those who need them most while respecting privacy and dignity.

Local Collaboration: Partner with Caritas Bamenda, CRS, World Food Programme, and local community-based organizations already providing humanitarian assistance in the region .

Project Idea 5: Agricultural Market Linkage & Extension Platform

The Problem: The Northwest Region is traditionally productive agriculturally, but farmers face multiple challenges: market access disrupted by conflict, lack of timely agricultural information, post-harvest losses due to poor storage, and difficulty connecting with buyers . The government is investing in digital transformation of the agropastoral sector, creating opportunities for complementary innovation .

The Software Solution: A mobile-first platform that connects farmers in the Northwest Region with markets, agricultural extension services, and supply chain resources to improve food security and farmer incomes despite conflict-related challenges.

Core Features:

- **Market Price Information:** Real-time commodity prices from markets across the region to help farmers get fair value
- **Direct Buyer Linkage:** Connect farmers with restaurants, hotels, and food processors who need reliable supply
- **Agricultural Extension:** Push notifications with planting calendars, pest alerts, and climate-adaptive techniques
- **Input Supply Marketplace:** Connect farmers with seeds, fertilizer, and equipment suppliers

- **Storage & Transport Booking:** Shared access to storage facilities and transport for market days
- **Producer Groups:** Facilitate farmer cooperatives for collective marketing and bargaining power

Impact: This platform addresses the agricultural value chain disruptions caused by the crisis while building on government initiatives to modernize the sector . It would improve food security, increase farmer incomes, and support economic recovery in the region's traditional economic base.

Local Collaboration: Partner with MINEPIA (Ministry of Livestock, Fisheries, and Animal Industries), local agricultural cooperatives, and organizations like CEMASUD that already integrate agriculture with technology training .
